

WHAT IS CLAIMED IS:

1. A method for reducing noise in a sampled acoustic signal, comprising:
- 5 receiving a stream of sampled acoustic signals;  
selecting a fixed number of samples;  
multiplying the samples by a windowing function;  
computing the fast Fourier transform of the windowed samples to yield transformed windowed signals;  
10 selecting half of the transformed windowed signals;  
calculating a power estimate of the transformed windowed signals;  
calculating a smoothed power estimate by smoothing the power estimate over time;  
calculating a noise estimate;  
15 calculating a gain function from the noise estimate and the smoothed power estimate.  
calculating a transformed speech signal by multiplying the gain function with the transformed windowed signal;  
calculating an inversed fast Fourier transform of the transformed speech signal to yield a sampled speech signal;  
20 and  
adding the sampled speech signal to a portion of the speech signal of a previous frame.
- 25 2. The method of Claim 1, wherein the fixed number of samples is thirty-two.
3. The method of Claim 1, wherein the windowing function is a hanning window function.
- 30 4. The method of Claim 1, wherein the power estimate is calculated by using the absolute value of the power estimate.
- 35 5. The method of Claim 1, wherein the power estimate is calculated using a squared power estimation.

6. The method of Claim 1, wherein the noise estimation is calculated by increasing a noise spectral estimate by a small margin.

5 7. The method of Claim 1, wherein the gain function, is of the form:

$$G(i) = 1 - \gamma \frac{|N^n(i)|}{P^t(i)}$$

where  $\alpha$  is a predetermined constant.

10 8. The method of Claim 1, wherein the gain function  $G(i)$  is the form

$$1 + \lambda - \gamma \frac{|N(i)|^2}{P^t(i)}$$

where  $\lambda$ ,  $\gamma$  are predetermined coefficients.

0448353 01400

9. A system for reducing noise in an acoustical signal comprising:

a sampler for obtaining discrete samples of the acoustical signal;

5 an analog to digital converter coupled to the sampler  
an operable to convert the analog discrete samples into a digitized sample;

a noise suppression circuit coupled to the analog to digital converter and operable to:

10 receive the analog discrete samples;

select a fixed number of samples;

multiply the samples by a windowing function;

compute the fast Fourier transform of the windowed samples to yield transformed windowed signals;

15 select half of the transformed windowed signals;

calculate a power estimate of the transformed windowed signals;

calculate a smoothed power estimate by smoothing the power estimate over time;

20 calculate a noise estimate;

calculate a gain function from the noise estimate and the smoothed power estimate.

calculate a transformed speech signal by multiplying the gain function with the transformed windowed signal;

25 calculate an inversed fast Fourier transform of the transformed speech signal to yield a sampled speech signal; and

30 add the sampled speech signal to a portion of the speech signal of a previous frame.

10. The system of Claim 9, wherein the fixed number of samples is thirty-two.

11. The system of Claim 9, wherein the windowing function is a hanning window function.

5 12. ~~The system of Claim 9, wherein the power estimate is calculated by using the absolute value of the power estimate.~~

10 13. ~~The system of Claim 9, wherein the power estimate is calculated using a squared power estimation.~~

14. The system of Claim 9, wherein the noise estimation is calculated by increasing a noise spectral estimate by a small margin.

15 15. ~~The system of Claim 9, wherein the gain function, is of the form:~~

$$G(i) = 1 - \gamma \frac{|N^n(i)|}{P^t(i)}$$

where  $\alpha$  is a predetermined constant.

20 16. The system of Claim 9, wherein the gain function  $G(i)$  is the form

$$1 + \lambda - \gamma \frac{|N(i)|^2}{P^t(i)}$$

~~where  $\lambda$ ,  $\gamma$  are predetermined coefficients.~~
